

Automation of Invoice Reporting with UiPath

Safiyyah Silvera

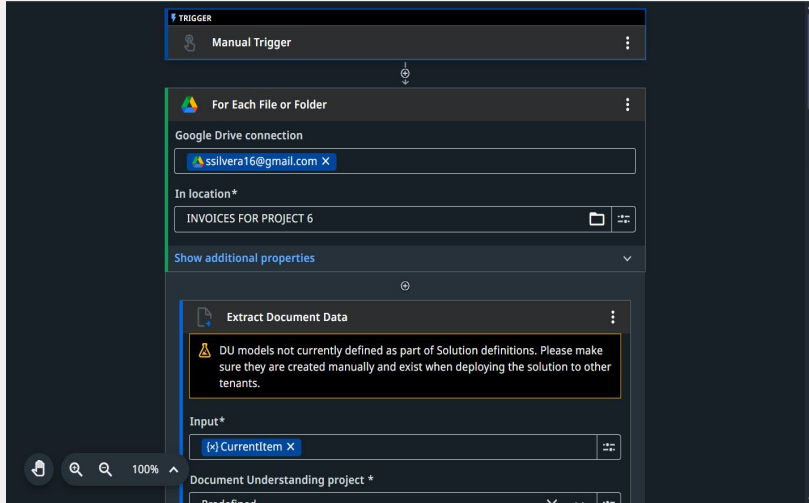

Problem

Our company receives weekly invoices from various suppliers. Finance managers lack the time to manually open and review each document to track payment deadlines and understand purchase details. The current manual process in place requires staff to extract key information (invoice number, supplier, due date, amount) and write purchase descriptions of each invoice. This is time consuming, error is prone to happen and prevents managers from getting insight to company purchases. This workflow is inefficient and delays payment processing. This makes it difficult to maintain financial records especially with specific financial record reports by a certain date.

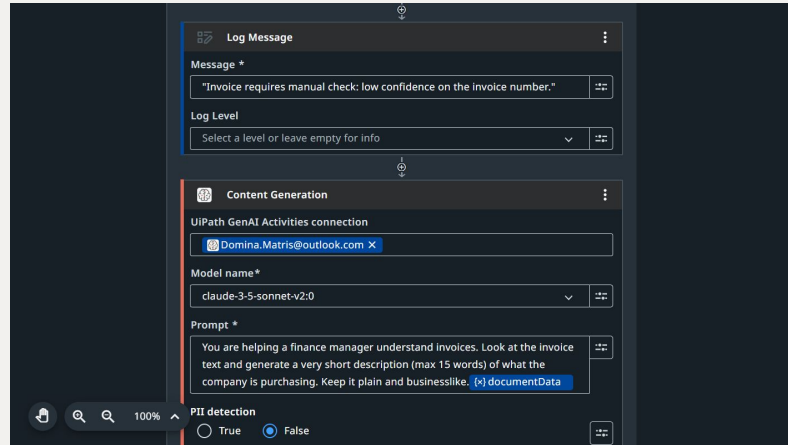

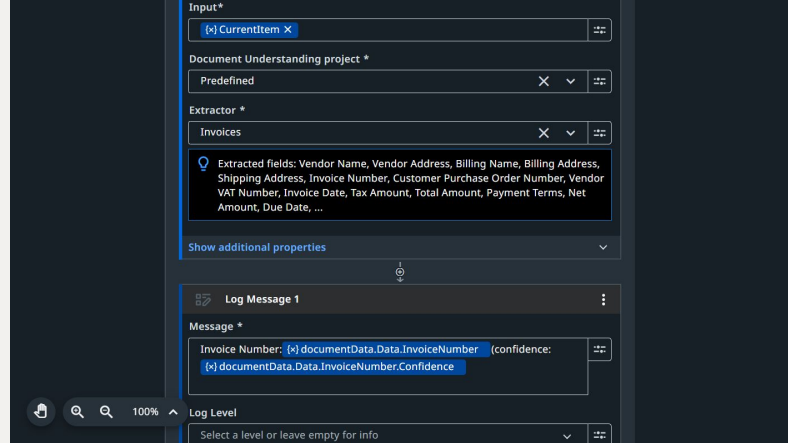

Solution

I've developed an automated RPA workflow using UiPath which eliminates manual invoice processing by combining Document Understanding (DU) and AI technologies. This solution reads invoices directly from Google Drives, uses machine learning to extract key financial data (invoice number, supplier, due date, total amount) and employs GenAI Content Generation to create concise purchase descriptions. This workflow includes quality control by checking confidence levels (if the confidence level falls below 0.7, it logs a warning for manual review). All the extracted data is automatically written to Google Sheet (five columns). This gives the managers instant access to comprehensive invoice information. This workflow filters results to show only invoices due by the specified deadline. Managers are able to prioritize payments and understand company purchases without opening individual documents. This RPA automation workflow transforms a time-consuming manual process into an efficient, accurate and scalable solution.

RPA Workflow execution ended

Benefits

Time Efficiency

Eliminated hours of manual invoice review by automatically extracting key data and generating purchase descriptions in seconds, freeing finance managers for strategic tasks.

Enhanced Accuracy

Reduces human errors through AI-powered data extraction with built-in confidence validation, ensuring reliable financial records and payment tracking.

Improved Decision-Making

Provides instant access to structured invoice data with AI-generated purchases insights, enabling managers to quickly prioritize payments and understand company spending patterns.

Challenges & improvements

While putting this workflow together I struggled with:

- Getting invoice data to populate in google sheets.
- Getting the log messages to notify invoices skipped and invoices with low confidence level. Created two separate workflows to compare log messages and ability to extract data. Ultimately the original workflow proved to be successful.
